

When Is Discrimination Unfair

Replication Package

1_Data Construction

This document provides an overview of the steps taken to convert the raw survey data set into a usable format for conducting the analyses of the paper. It provides a description of the relevant files needed to organize the raw data set and a list of steps to conduct this task.

Description of Files

This folder contains the following files:

aa_when_is_discrimination_unfair_raw_data.csv (*required*)

File **aa** is the raw data set for the paper – i.e., it is output from Qualtrics, the program used to administer the survey.

bb_when_is_discrimination_unfair_organize_data.do (*required*)

File **bb** is a do-file that organizes **aa** into a usable format for conducting the paper's analyses – its final output is file **d1 when is discrimination unfair data set.dta** in folder 2 Main Analyses.

cc_acs_weights.dta (*optional*)

File **cc** is a dta file that contains the shares of individuals from the 2019 ACS of certain (age x education x race x gender) cells. This file is used to calculate weights based on this survey.

It is the output from R file **jj.vii**.

dd_first_stage.csv (*required*)

File **dd** is a csv file that indicates whether each observation (i.e., a scenario from each respondent) from the organized data set belongs in Stage 1 or 2 of the survey.

ee_gss_weights.dta (*optional*)

File **ee** contains survey weights based on the 2020 GSS.

It is the output from R file **jj.viii**.

ff_sample_weights.dta (*optional*)

File **ff** contains the “sample” shares of individuals from the MTurk sample of certain (age x education x race x gender) cells. It is also used to develop survey weights based on the 2019 ACS.

It is the output from R file **jj.ix**.

gg_state_data.dta (*required*)

File **gg** contains state and census region data for each MTurk respondent.

hh_suspicious_variables2.dta (*required*)

File **hh** flags all respondents we suspect were automated or extremely low quality.

ii_mturk_data_for_weights.csv (*optional*)

File **ii** indicates the (age x education x race x gender) cell for each MTurk respondent.

It is the output from Do file **bb**.

jj_Materials for weights (*required*)

File **jj** is a folder containing material for developing the survey weights. Within this folder are a set of files.

- i. **acs2019.dta** (*required*)
[source: CEPR Data – ACS, “cepr_acs_2019.zip,” <https://ceprdata.org/acs-uniform-data-extracts/acs-data/>]
File **jj.i** is the 2019 ACS sample provided by CEPR.
- ii. **gss2020.dta** (*required*)
[source: General Social Survey, “GSS 2016-2020 Panel,” <https://gss.norc.org/get-the-data/stata>]
File **jj.ii** is the 2020 GSS sample (derived to only the key variables needed for the weights).
- iii. **mturk_data_for_weights.csv** (*required before running file **jj.ix***)
File **jj.iii** is the same as file **ii**. It is the output from Do file **bb**.
- iv. **surveys_organize_for_weights.do** (*required*)
File **jj.iv** is a do-file that augments **jj.i** and **jj.ii** into a similar format as **jj.iii**. The outputs are **jj.v** and **jj.vi**.
- v. **asc_data.csv** (*optional*)
File **jj.v** is the outputs of do file **jj.iv**.
- vi. **gss_data.csv** (*optional*)
File **jj.vi** is the outputs of do file **jj.iv**.
- vii. **acs_weights.R** (*required*)
Files **jj.vii** takes **jj.v** as input to calculate the “population” shares of ACS respondents across demographic and political leaning cells. The output is **cc**.
- viii. **gss_weights.R** (*required*)
Files **jj.viii** takes **jj.vi** as input to calculate the “population” shares of GSS respondents across demographic and political leaning cells. The output is **ee**.

- ix.** sample_weights.R (*required*)
Similarly, file **jj.ix** takes **jj.iii** as an input to calculate the “sample” shares of respondents within cells of demographic characteristics. The output is **ff**.

kk_census_state_pop2019.csv (*required*)

File **kk** is a csv file that contains state population from U.S. Census Bureau.

[source: U.S. Census Bureau, <https://www.census.gov/data/tables/time-series/demo/popest/2010s-state-detail.html> under "Population Estimates by Age (18+): July 1, 2019"]

ll_when_is_discrimination_unfair_prep_state_pop.do (*required*)

File **ll** is a do-file that organizes **kk** into a usable format for conducting the paper’s analyses – its output is file **d7 state pop.dta** in 2 Main Analyses folder.

How to prepare the Data Set from its Raw Version

1. Save files **aa**, **bb**, **dd**, **gg**, and **hh** to some folder. Similarly, save files **jj.i-jj.ix** to some folder. Also, save files **kk** and **ll** to some folder. They may all be in the same location if you wish.
2. Open file **bb** and make sure that the directory is set properly (i.e, check the “cd” command). The do-file must access **aa**, **dd**, **gg**, and **hh**.
3. Check line 329 since it merges in data from file **gg** using the “merge” command.
4. Run lines 1-513 of do-file **bb** – i.e., through the chunk of code commented as “Export a data set used to create weights.” This last chunk of code spits out file **ii (jj.iii)**. Do not close out of file **bb** yet.
5. (Optional) Run do file **jj.iv** to create files **jj.v** and **jj.vi**. Make sure the directory within the do file is set appropriately to access the ACS and GSS data sets (**jj.i** and **jj.ii**).
6. (Optional) Run the R code within **jj.vii-jj.ix**. Make sure the directory within these R files are set appropriately so they can access **jj.v**, **jj.vi**, and **jj.iii**, respectively. They provide **cc**, **ee**, and **ff** in csv format.
7. (Optional) Save the outputs **cc**, **ee**, and **ff** dta files and name them appropriately if necessary (e.g., “cc_acs_weights.dta”). Make sure these are stored in locations that could be accessed by do file **bb**.
8. Run the remaining lines of do file **bb**. These merge files **cc**, **ee**, and **ff**, so make sure the directories are set appropriately within the “merge” commands (look at lines 516-544).
9. Run do file **ll** to create **d7_state_pop.dta** in 2_Main Analyses folder.

Steps 5-7 demonstrate how the survey weights were developed, and they are optional. If you save files **cc**, **ee**, **ff** within the same folder as **bb**, you don’t need to do step 5-7, and you can just run the entire file **bb** to obtain the organized data set.
